

Aufgabe 4 a) Beh:  $(C(\bar{\Omega}, Y), \|\cdot\|_{C(\bar{\Omega}, Y)})$   $\text{BR}$

$\forall \varepsilon > 0$

Bu  $\exists \delta \in (0, \varepsilon)$   $C(\bar{\Omega}, Y)$  CF, also  $\exists N \in \mathbb{N} \forall p, q \geq N: \varepsilon > \|f_p - f_q\|_{C(\bar{\Omega}, Y)}$

$$= \sup_{x \in \bar{\Omega}} \|f_p(x) - f_q(x)\|_Y \geq \|f_p(x) - f_q(x)\|_Y \quad f \text{ alle } x \in \bar{\Omega} \quad \text{Also ist } (f_n(x))_{n \in \mathbb{N}}$$

CF und somit konvergent, da  $Y$  BR. Dfm  $f(x) := \lim_{n \rightarrow \infty} f_n(x)$ ,

$$f: \bar{\Omega} \rightarrow Y \quad \forall x \in \bar{\Omega}: \|f_p(x) - f_q(x)\|_Y \leq \varepsilon \quad \Rightarrow \forall x: \lim_{q \rightarrow \infty} \|f_p(x) - f_q(x)\|_Y$$

$$\stackrel{\| \cdot \|_Y \text{ stetig}}{=} \square \quad \|f_p(x) - f(x)\|_Y < \varepsilon \quad \square \quad \|f_p - f\|_{C(\bar{\Omega}, Y)}$$

$$\square \quad \varepsilon \quad (\text{also } f_p \rightarrow f) \text{ gilt.}$$

$\square$

$$= \sup_{x \in \bar{\Omega}} \|f_p(x) - f(x)\|_Y$$

□ Let  $f$  satisfy the ca:  $\forall \epsilon > 0 \exists \delta > 0: |x-y| < \delta \Rightarrow \|f(x) - f(y)\| < \epsilon$ .

Since  $P_1$  is so gross,  $\text{class } \|f_p(x) - f_q(x)\| < \epsilon \quad \forall x \in \mathbb{R}^n$ .  $\text{Dc } f_p$  and  $\text{Dc } f_q$  and

$f_q$  satisfy  $\text{and } \text{sub } \delta > 0$  so  $\text{class } \|f_p(x) - f_p(y)\| < \epsilon$  used

$$\|f_p(x) - f_q(x)\| < \epsilon \quad \forall |x-y| < \delta. \quad \text{Also}$$

$$\begin{aligned} \|f(x) - f(y)\| &\leq \|f_p(x) - f_p(y)\| + \|f_p(x) - f_q(x)\| + \|f_q(x) - f_q(y)\| + \|f_q(y) - f(y)\| \\ &\quad + \|f_q(y) - f(y)\| < 4\epsilon \end{aligned}$$

□  $\text{and } \square$   $\text{and } \|f_p(x) - f(x)\| < \epsilon, \|f_q(x) - f(x)\| < \epsilon$   $\text{and } \square$ .
