finite Coxeter
groups

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.
- ▶ Let $\ell_S : W \rightarrow \mathbb{Z}_{\geq 0}$ be the classical length function wrt the generating set S .

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.
- ▶ Let $l_S : W \rightarrow \mathbb{Z}_{\geq 0}$ be the classical length function wrt the generating set S . If $W = \mathfrak{S}_n$ and $w \in W$ with cycle decomposition $w = c_1 c_2 \cdots c_k$, then (in general)

$$l_S(w) \neq \sum_i l_S(c_i).$$

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.
- ▶ Let $l_S : W \rightarrow \mathbb{Z}_{\geq 0}$ be the classical length function wrt the generating set S . If $W = \mathfrak{S}_n$ and $w \in W$ with cycle decomposition $w = c_1 c_2 \cdots c_k$, then (in general)

$$l_S(w) \neq \sum_i l_S(c_i).$$

This is rather bad news.

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.
- ▶ Let $\ell_S : W \rightarrow \mathbb{Z}_{\geq 0}$ be the classical length function wrt the generating set S . If $W = \mathfrak{S}_n$ and $w \in W$ with cycle decomposition $w = c_1 c_2 \cdots c_k$, then (in general)

$$\ell_S(w) \neq \sum_i \ell_S(c_i).$$

This is rather bad news.

- ▶ But: if you consider the length function ℓ_T with respect to the set T of transpositions of \mathfrak{S}_n , then

$$\ell_T(w) = \sum_i \ell_T(c_i) !$$

Changing the generating set

- ▶ Let (W, S) be a Coxeter system.
- ▶ Let $\ell_S : W \rightarrow \mathbb{Z}_{\geq 0}$ be the classical length function wrt the generating set S . If $W = \mathfrak{S}_n$ and $w \in W$ with cycle decomposition $w = c_1 c_2 \cdots c_k$, then (in general)

$$\ell_S(w) \neq \sum_i \ell_S(c_i).$$

This is rather bad news.

- ▶ But: if you consider the length function ℓ_T with respect to the set T of transpositions of \mathfrak{S}_n , then

$$\ell_T(w) = \sum_i \ell_T(c_i) !$$

Moreover, the set T is the set of all the conjugates to elements of S . In the Coxeter theoretic language: T is the set of *reflections* of W .

The “dual” approach

Generalized cycle decompositions and quasi-Coxeter elements in Coxeter groups

Thomas Gobet

Coxeter groups

Cycle decompositions in arbitrary Coxeter groups

Parabolic quasi-Coxeter elements

Cycle decompositions in finite Coxeter groups

The “dual” approach

- ▶ There is a so-called “dual” approach to study a Coxeter group, initiated by Bessis, Brady and Watt. The idea is to study W as a group generated by T , instead of S .

Example and remarks

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle.

Example and remarks

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle.

Example and remarks

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle. But w is also a quasi-Coxeter element in a reflection subgroup W' of type $B_2 \times B_2$, in which its cycle decomposition has two factors $c_1 = (2, 1, -2, -1)$ and $c_2 = (3, 4, -3, -4)$.

Example and remarks

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle. But w is also a quasi-Coxeter element in a reflection subgroup W' of type $B_2 \times B_2$, in which its cycle decomposition has two factors $c_1 = (2, 1, -2, -1)$ and $c_2 = (3, 4, -3, -4)$.
- ▶ In finite Coxeter groups, an element w is a pqc if and only if there exists a qc $q \in W$ such that $\ell_T(w) + \ell_T(w^{-1}q) = \ell_T(q)$ (which we write $w \leq_T q$).

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle. But w is also a quasi-Coxeter element in a reflection subgroup W' of type $B_2 \times B_2$, in which its cycle decomposition has two factors $c_1 = (2, 1, -2, -1)$ and $c_2 = (3, 4, -3, -4)$.
- ▶ In finite Coxeter groups, an element w is a pqc if and only if there exists a qc $q \in W$ such that $\ell_T(w) + \ell_T(w^{-1}q) = \ell_T(q)$ (which we write $w \leq_T q$). In infinite W , there are elements $w \leq_T c$ for c a Coxeter element which fail to be pqc.

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle. But w is also a quasi-Coxeter element in a reflection subgroup W' of type $B_2 \times B_2$, in which its cycle decomposition has two factors $c_1 = (2, 1, -2, -1)$ and $c_2 = (3, 4, -3, -4)$.
- ▶ In finite Coxeter groups, an element w is a pqc if and only if there exists a qc $q \in W$ such that $\ell_T(w) + \ell_T(w^{-1}q) = \ell_T(q)$ (which we write $w \leq_T q$). In infinite W , there are elements $w \leq_T c$ for c a Coxeter element which fail to be pqc. But it still seems that we have Hurwitz transitivity on $\text{Red}_T(w)$.

- ▶ Consider the quasi-Coxeter element $w = s_1 s_2 s_1 s_0 s_2 s_3$ in W of type D_4 from before. In W , w is a cycle. Viewing W inside a Coxeter group \widetilde{W} of type B_4 , we have $w = (2, 1, -2, -1)(3, 4, -3, -4)$. In the reflection subgroup W (which is not parabolic), w is a quasi-Coxeter element which is a cycle. But w is also a quasi-Coxeter element in a reflection subgroup W' of type $B_2 \times B_2$, in which its cycle decomposition has two factors $c_1 = (2, 1, -2, -1)$ and $c_2 = (3, 4, -3, -4)$.
- ▶ In finite Coxeter groups, an element w is a pqc if and only if there exists a qc $q \in W$ such that $\ell_T(w) + \ell_T(w^{-1}q) = \ell_T(q)$ (which we write $w \leq_T q$). In infinite W , there are elements $w \leq_T c$ for c a Coxeter element which fail to be pqc. But it still seems that we have Hurwitz transitivity on $\text{Red}_T(w)$. It is therefore natural to study reflection subgroups defined by (reduced expressions of) such elements, as generalizations of parabolic subgroups.

Merci !
