May 31, 2007<sup>§</sup>

## Abstract

Quillen's algebraic  $K$ -theory is reconstructed via Voevodsky's algebraic cobordism. More precisely, for a ground field  $k$  the algebraic cobordism  $\mathbf{P}^1$ -spectrum  $\mathrm{MGL}$  of Voevodsky is considered as a commutative ring  $\mathbf{P}^1$ -spectra. Setting  $\mathrm{MGL}^i = \bigoplus_{2q-p=i} \mathrm{MGL}^{p,q}$  we regard the bigraded theory  $\mathrm{MGL}^{p,q}$  as just a graded theory. There is a unique ring morphism  $\phi: \mathrm{MGL}^0(k) \rightarrow \mathbb{Z}$  which sends the class  $[X]_{\mathrm{MGL}}$  of a smooth projective  $k$ -variety  $X$  to the Euler characteristic  $\chi(X, \mathcal{O}_X)$  of the structure sheaf  $\mathcal{O}_X$ . Our main result states that there is a canonical grade preserving isomorphism of ring cohomology theories on the category  $\mathrm{Sm}\mathcal{O}p/k$

$$\varphi: \mathrm{MGL}^*(X, U) \otimes_{\mathrm{MGL}^0(k)} \mathbb{Z} \rightarrow \mathrm{K}_{-*}^{TT}(X, U) = \mathrm{K}'_{-*}(X - U),$$

in the sense of [PS1], where  $\mathrm{K}_{*}^{TT}$  is the Thomason-Trobaugh  $K$ -theory and  $\mathrm{K}'_{*}$  is Quillen's  $K'$ -theory. In particular, the left hand side is a ring cohomology theory. Moreover both theories are oriented in the sense of [PS1] and  $\varphi$  respects the orientations. The result is an algebraic version of a theorem due to Conner and Floyd. That theorem reconstructs complex  $K$ -theory via complex cobordism [CF].

# 1 A motivic version of a theorem by Conner and Floyd

Our main result relates Voevodsky’s algebraic cobordism theory  $\mathrm{MGL}^{*,*}$  to Quillen’s  $K'$ -theory. We refer to [PPR1, Appendix] for the basic terminology, notation, constructions, definitions, results. Let  $S$  be a Noetherian separated finite-dimensional scheme  $S$ . One may think of  $S$  being the spectrum of a field or the integers. A *motivic space over  $S$*  is a functor

$$A: \mathcal{S}m/S^{op} \rightarrow \mathbf{sSet}$$

(see [PPR1, Appendix]). The category of motivic spaces over  $S$  is denoted  $\mathbf{M}(S)$ . This definition of a motivic space is different from the one considered by Morel and Voevodsky in [MV] – they consider only those simplicial presheaves which are sheaves in the Nisnevich topology on  $\mathcal{S}m/S$ . With our definition the Thomason-Trobaugh  $K$ -theory functor obtained by using big vector bundles is a motivic space on the nose. It is not a simplicial Nisnevich sheaf. This is why we prefer to work with the above notion of “space”.

We write  $\mathbf{H}_\bullet^{\mathrm{cm}}(S)$  for the pointed motivic homotopy category and  $\mathrm{SH}^{\mathrm{cm}}(S)$  for the stable motivic homotopy category over  $S$  as constructed in [PPR1, A.3.9, A.5.6]. By [PPR1, A.3.11 resp. A.5.6] there are canonical equivalences to  $\mathbf{H}_\bullet(S)$  of [MV] resp.  $\mathrm{SH}(S)$  of [V1]. Both  $\mathbf{H}_\bullet^{\mathrm{cm}}(S)$  and  $\mathrm{SH}^{\mathrm{cm}}(S)$  are equipped with closed symmetric monoidal structures such that the  $\mathbf{P}^1$ -suspension spectrum functor is a strict symmetric monoidal functor

$$\Sigma_{\mathbf{P}^1}^\infty: \mathbf{H}_\bullet^{\mathrm{cm}}(S) \rightarrow \mathrm{SH}^{\mathrm{cm}}(S).$$

Here  $\mathbf{P}^1$  is considered as a motivic space pointed by  $\infty \in \mathbf{P}^1$ . The symmetric monoidal structure  $(\wedge, \mathbb{I}_S = \Sigma_{\mathbf{P}^1}^\infty S_+)$  on the homotopy category  $\mathrm{SH}^{\mathrm{cm}}(S)$  is constructed on the model category level by employing the category  $\mathbf{MSS}(S)$  of symmetric  $\mathbf{P}^1$ -spectra. It satisfies the properties required by Theorem 5.6 of Voevodsky congress talk [V1]. From now on we will usually omit the superscript  $(-)^{\mathrm{cm}}$ .

Given a  $\mathbf{P}^1$ -spectrum  $E$  one has a cohomology theory on the category of pointed spaces. Namely, for a pointed space  $(A, a)$  set  $E^{p,q}(A, a) = \mathrm{Hom}_{\mathbf{H}_\bullet^{\mathrm{cm}}(S)}(\Sigma_{\mathbf{P}^1}^\infty(A, a), \Sigma^{p,q}(E))$  and  $E^{*,*}(A, a) = \bigoplus_{p,q} E^{p,q}(A, a)$ . A cohomology theory on the category of non-pointed spaces is defined as follows. For a non-pointed space  $A$  set  $E^{p,q}(A) = E^{p,q}(A_+, +)$  and  $E^{*,*}(A) = \bigoplus_{p,q} E^{p,q}(A)$ .

Each  $X \in \mathcal{S}m/S$  defines a motivic space constant in the simplicial direction taking an  $S$ -smooth  $U$  to  $\mathrm{Mor}_S(U, X)$ . This motivic space is non-pointed. So we regard  $S$ -smooth varieties as motivic spaces (non-pointed) and set

$$E^{p,q}(X) = E^{p,q}(X_+, +).$$

Given a  $\mathbf{P}^1$ -spectrum  $E$  we will reduce the double grading on the cohomology theory  $E^{*,*}$  to a grading. Namely, set  $E^m = \bigoplus_{m=p-2q} E^{p,q}$  and  $E^* = \bigoplus_m E^m$ . We often will write  $E^*(k)$  for  $E^*(\mathrm{Spec}(k))$  below in this text.

A  $\mathbf{P}^1$ -ring spectrum is a monoid  $(E, \mu, e)$  in  $(\mathrm{SH}(S), \wedge, \mathbb{I}_S)$ . A commutative  $\mathbf{P}^1$ -ring spectrum is a commutative monoid  $(E, \mu, e)$  in  $(\mathrm{SH}(S), \wedge, 1)$ .

The cohomology theory  $E^*$  defined by a  $\mathbf{P}^1$ -ring spectrum is a ring cohomology theory. The cohomology theory  $E^*$  defined by a commutative  $\mathbf{P}^1$ -ring spectrum is a ring cohomology theory, however it is not necessary graded commutative. The cohomology theory  $E^*$  defined by an oriented commutative  $\mathbf{P}^1$ -ring spectrum is a graded commutative ring cohomology theory.

Occasionally a  $\mathbf{P}^1$ -ring spectrum  $(E, \mu, e)$  might have a model  $(E', \mu', e')$  which is a symmetric  $\mathbf{P}^1$ -ring spectrum, that is, a symmetric  $\mathbf{P}^1$ -spectrum  $E'$  equipped with a strict multiplication  $\mu': E' \wedge E' \rightarrow E'$  which is strictly associative and strictly unital for the unit  $e': \Sigma_{\mathbf{P}^1}^\infty(S_+) \rightarrow E'$ . This is the case for the algebraic cobordism  $\mathbf{P}^1$ -ring spectrum  $\mathbf{MGL}$ , as described below. Such a model for the algebraic  $K$ -theory  $\mathbf{P}^1$ -ring spectrum  $\mathbf{BGL}$  is currently not known to us.

For the rest of the paper let  $k$  be a field and  $S = \mathrm{Spec}(k)$ . Usually  $S$  will be replaced by  $k$  in the notation. We work in this text with the algebraic cobordism  $\mathbf{P}^1$ -spectrum  $\mathbf{MGL}$  and the algebraic  $K$ -theory  $\mathbf{P}^1$ -spectrum  $\mathbf{BGL}$  as described in [PPR1, Defn. 1.2.4] and [PPR2, Sect. 2.1] respectively. The spectrum  $\mathbf{MGL}$  is a commutative ring  $\mathbf{P}^1$ -spectrum by that construction. The spectrum  $\mathbf{BGL}$  is equipped with a structure of a commutative  $\mathbf{P}^1$ -ring spectrum as explained in [PPR1, Thm. 2.1.1]. Let  $K_*^{TT}$  be Thomason-Trobaugh  $K$ -theory functor [TT]. There is a canonical isomorphism

$$Ad: K_{-*}^{TT} \rightarrow \mathbf{BGL}^{*,0}$$

of ring cohomology theories on the category  $\mathcal{S}m\mathcal{O}p/S$  in the sense of [PS1]. An invertible Bott element  $\beta \in \mathbf{BGL}^{2,1}(\mathrm{Spec}(k))$  is constructed in [PPR1, Section 1.3]. For every pointed motivic space  $A$  the morphism

$$\mathbf{BGL}^{*,0}(A) \otimes \mathbf{BGL}^0(\mathrm{Spec}(k)) \rightarrow \mathbf{BGL}^{*,*}(A) \quad (1)$$

given by  $a \otimes b \mapsto a \cup b$  is a ring isomorphism by [PPR1, Sect. 1.3]. Furthermore  $\mathbf{BGL}^0(\mathrm{Spec}(k)) = \mathbb{Z}[\beta, \beta^{-1}]$  is the ring of Laurent polynomials on the Bott element  $\beta$ . To say the same in a different way,

$$\mathbf{BGL}^{*,0}(A)[\beta, \beta^{-1}] \cong \mathbf{BGL}^{*,*}(A). \quad (2)$$

The special case  $A = X/(X \setminus Z)$  where  $X$  is a smooth  $k$ -variety and  $Z \subset X$  is a closed subset implies the following result [PPR1, Cor. 1.3.6].

**Corollary 1.0.1.** *Let  $X$  be a smooth  $k$ -scheme,  $Z$  a closed subset of  $X$  and  $U = X \setminus Z$  its open complement. Then there are isomorphisms*

$$K_{-*,Z}^{TT}(X)[\beta, \beta^{-1}] \cong \mathrm{BGL}^{*,*}(X/U) = \mathrm{BGL}^*(X/U) \quad (3)$$

$$K_{-*,Z}^{TT}(X) \cong \mathrm{BGL}^{*,*}(X/U)/(\beta + 1)\mathrm{BGL}^{*,*}(X/U) \quad (4)$$

of ring cohomology theories on  $\mathrm{SmOp}/k$  in the sense of [PS1].

We refer to [PPR2] for a construction of the commutative ring  $\mathbf{P}^1$ -spectrum MGL. For the purposes of the present preprint we will need to know only two properties of that spectrum. Those properties are: Quillen universality and MGL-cellularity (see Subsection 2.1 below).

## 1.1 Oriented commutative ring spectra

Following Adams and Morel we define an orientation of a commutative  $\mathbf{P}^1$ -ring spectrum. However we prefer to use Thom classes instead of Chern classes. Consider the pointed motivic space  $\mathbf{P}^\infty = \mathrm{colim}_{n \geq 0} \mathbf{P}^n$  having base point  $g_1: S = \mathbf{P}^0 \hookrightarrow \mathbf{P}^\infty$ .

The tautological “vector bundle”  $\mathcal{T}(1) = \mathcal{O}_{\mathbf{P}^\infty}(-1)$  is also known as the Hopf bundle. It has zero section  $z: \mathbf{P}^\infty \hookrightarrow \mathcal{T}(1)$ . The fiber over the point  $g_1 \in \mathbf{P}^\infty$  is  $\mathbb{A}^1$ . For a vector bundle  $V$  over a smooth  $S$ -scheme  $X$  with zero section  $z: X \hookrightarrow V$  consider a Nisnevich sheaf associated with the presheaf  $Y \mapsto V(Y)/(V \setminus z(X))(Y)$  on the Nisnevich site  $\mathrm{Sm}/S$ . The *Thom space*  $\mathrm{Th}(V)$  of  $V$  is defined as that Nisnevich sheaf regarded as a presheaf. In particular  $\mathrm{Th}(V)$  is a pointed motivic space in the sense of [PPR1, Defn. A.1.1]. Its Nisnevich sheafification coincides with Voevodsky’s Thom space [V1, p. 422], since  $\mathrm{Th}(V)$  is already a Nisnevich sheaf. The Thom space of the Hopf bundle is then defined as the colimit  $\mathrm{Th}(\mathcal{T}(1)) = \mathrm{colim}_{n \geq 0} \mathrm{Th}(\mathcal{O}_{\mathbf{P}^n}(-1))$ . Abbreviate  $T = \mathrm{Th}(\mathbf{A}_S^1) = \mathbf{A}_S^1/(\mathbf{A}_S^1 \setminus \{0\})$ .

Let  $E$  be a commutative ring  $\mathbf{P}^1$ -spectrum. The unit gives rise to an element  $1 \in E^{0,0}(\mathrm{Spec}(k)_+)$ . Applying the  $\mathbf{P}^1$ -suspension isomorphism to that element we get an element  $\Sigma_{\mathbf{P}^1}(1) \in E^{2,1}(\mathbf{P}^1/\{\infty\})$ . The canonical covering of  $\mathbf{P}^1$  defines motivic weak equivalences

$$\mathbf{P}^1/\{\infty\} \xrightarrow{\sim} \mathbf{P}^1/\mathbf{A}^1 \xleftarrow{\sim} \mathbf{A}^1/\mathbf{A}^1 \setminus \{0\} = T,$$

which in turn define pull-back isomorphisms  $E(\mathbf{P}^1/\{\infty\}) \leftarrow E(\mathbf{A}^1/\mathbf{A}^1 \setminus \{0\}) \rightarrow E(T)$ . Denote  $\Sigma_T(1)$  the image of  $\Sigma_{\mathbf{P}^1}(1)$  in  $E^{2,1}(T)$ .

**Definition 1.1.1.** *Let  $E$  be a commutative ring  $\mathbf{P}^1$ -spectrum. A Thom orientation of  $E$  is an element  $th \in E^{2,1}(\mathrm{Th}(\mathcal{T}(1)))$  such that its restriction to*

the Thom space of the fibre over the distinguished point coincides with the element  $\Sigma_T(1) \in E^{2,1}(T)$ . A Chern orientation of  $E$  is an element  $c \in E^{2,1}(\mathbf{P}^\infty)$  such that  $c|_{\mathbf{P}^1} = -\Sigma_{\mathbf{P}^1}(1)$ . An orientation of  $E$  is either a Thom orientation or a Chern orientation. Two Thom orientations of  $E$  coincide if respecting Thom elements coincides. Two Chern orientations of  $E$  coincide if respecting Chern elements coincides. One says that a Thom orientation  $th$  of  $E$  coincides with a Chern orientation  $c$  of  $E$  provided that  $c = z^*(th)$  or equivalently the element  $th$  coincides with the one  $th(\mathcal{O}(-1))$  given by (6) below.

**Remark 1.1.2.** The element  $th$  should be regarded as a Thom class of the tautological line bundle  $\mathcal{J}(1) = \mathcal{O}(-1)$  over  $\mathbf{P}^\infty$ . The element  $c$  should be regarded as a Chern class of the tautological line bundle  $\mathcal{J}(1) = \mathcal{O}(-1)$  over  $\mathbf{P}^\infty$ .

**Example 1.1.3.** The following orientations given right below are relevant for our work. Here MGL denotes the  $\mathbf{P}^1$ -ring spectrum representing algebraic cobordism obtained in [PPR2, Defn 2.1.1] and BGL denotes the  $\mathbf{P}^1$ -ring spectrum representing algebraic  $K$ -theory constructed in [PPR1, Theorem 2.2.1].

- Let  $u_1 : \Sigma_{\mathbf{P}^1}^\infty(\mathrm{Th}(\mathcal{J}(1)))(-1) \rightarrow \mathrm{MGL}$  be the canonical map of  $\mathbf{P}^1$ -spectra. Set  $th^{\mathrm{MGL}} = u_1 \in \mathrm{MGL}^{2,1}(\mathrm{Th}(\mathcal{J}(1)))$ . Since  $th^{\mathrm{MGL}}|_{\mathrm{Th}(\mathbf{1})} = \Sigma_{\mathbf{P}^1}(1)$  in  $\mathrm{MGL}^{2,1}(\mathrm{Th}(\mathbf{1}))$ , the class  $th^{\mathrm{MGL}}$  is an orientation of MGL.
- Set  $c = (-\beta) \cup ([\mathcal{O}] - [\mathcal{O}(1)]) \in \mathrm{BGL}^{2,1}(\mathbf{P}^\infty)$ . The relation (11) from [PPR1] shows that the class  $c$  is an orientation of BGL.

## 2 Oriented cohomology theories

Let  $(E, c)$  be an oriented commutative  $\mathbf{P}^1$ -ring spectrum. In this Section we compute the  $E$ -cohomology of infinite Grassmannians and their products. The results are the expected ones 2.0.6.

The oriented  $\mathbf{P}^1$ -ring spectrum  $(E, c)$  defines an oriented cohomology theory on  $\mathcal{S}m\mathcal{O}p$  in the sense of [PS1, Defn. 3.1] as follows. The restriction of the functor  $E^{*,*}$  to the category  $\mathcal{S}m/S$  is a ring cohomology theory. By [PS1, Th. 3.35] it remains to construct a Chern structure on  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p}$  in the sense of [PS1, Defn.3.2]. Let  $H(k)$  be the homotopy category of spaces over  $k$ . The functor isomorphism  $\mathrm{Hom}_{H(k)}(-, \mathbf{P}^\infty) \rightarrow \mathrm{Pic}(-)$  on the category  $\mathcal{S}m/S$  provided by [MV, Thm. 4.3.8] sends the class of the identity map  $\mathbf{P}^\infty \rightarrow \mathbf{P}^\infty$  to the class of the tautological line bundle  $\mathcal{O}(-1)$  over  $\mathbf{P}^\infty$ . For a line bundle  $L$  over  $X \in \mathcal{S}m/S$  let  $[L]$  be the class of

$L$  in the group  $\text{Pic}(X)$ . Let  $f_L: X \rightarrow \mathbf{P}^\infty$  be a morphism in  $\mathbf{H}(k)$  corresponding to the class  $[L]$  under the functor isomorphism above. For a line bundle  $L$  over  $X \in \mathcal{S}m/S$  set  $c(L) = f_L^*(c) \in E^{2,1}(X)$ . Clearly,  $c(\mathcal{O}(-1)) = c$ . The assignment  $L/X \mapsto c(L)$  is a Chern structure on  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p}$  since  $c|_{\mathbf{P}^1} = -\Sigma_{\mathbf{P}^1}(1) \in E^{2,1}(\mathbf{P}^1, \infty)$ . With that Chern structure  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p}$  is an oriented ring cohomology theory in the sense of [PS1]. In particular,  $(\text{BGL}, c^K)$  defines an oriented ring cohomology theory on  $\mathcal{S}m\mathcal{O}p$ .

Given this Chern structure, one obtains a theory of Thom classes  $V/X \mapsto th(V) \in E^{2\text{rank}(V), \text{rank}(V)}(\text{Th}_X(V))$  on the cohomology theory  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p/S}$  in the sense of [PS1, Defn. 3.32] as follows. There is a unique theory of Chern classes  $V \mapsto c_i(V) \in E^{2i,i}(X)$  such that for every line bundle  $L$  on  $X$  one has  $c_1(L) = c(L)$ . For a rank  $r$  vector bundle  $V$  over  $X$  consider the vector bundle  $W := \mathbf{1} \oplus V$  and the associated projective vector bundle  $\mathbf{P}(W)$  of lines in  $W$ . Set

$$\bar{th}(V) = c_r(p^*(V) \otimes \mathcal{O}_{\mathbf{P}(W)}(1)) \in E^{2r,r}(\mathbf{P}(W)). \quad (5)$$

It follows from [PS1, Cor. 3.18] that the support extension map

$$E^{2r,r}(\mathbf{P}(W)/(\mathbf{P}(W) \setminus \mathbf{P}(\mathbf{1}))) \rightarrow E^{2r,r}(\mathbf{P}(W))$$

is injective and  $\bar{th}(E) \in E^{2r,r}(\mathbf{P}(W)/(\mathbf{P}(W) \setminus \mathbf{P}(\mathbf{1})))$ . Set

$$th(E) = j^*(\bar{th}(E)) \in E^{2r,r}(\text{Th}_X(V)), \quad (6)$$

where  $j: \text{Th}_X(V) \rightarrow \mathbf{P}(W)/(\mathbf{P}(W) \setminus \mathbf{P}(\mathbf{1}))$  is the canonical motivic weak equivalence of pointed motivic spaces induced by the open embedding  $V \hookrightarrow \mathbf{P}(W)$ . The assignment  $V/X$  to  $th(V)$  is a theory of Thom classes on  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p}$  (see the proof of [PS1, Thm. 3.35]). So the Thom classes are natural, multiplicative and satisfy the following Thom isomorphism property.

**Theorem 2.0.4.** *For a rank  $r$  vector bundle  $p: V \rightarrow X$  on  $X \in \mathcal{S}m/S$  with zero section  $z: X \hookrightarrow V$ , the map*

$$\cup th(V): E^{*,*}(X) \rightarrow E^{*+2r, *+r}(V/(V \setminus z(X)))$$

*is an isomorphism of the two-sided  $E^{*,*}(X)$ -modules, where  $- \cup th(V)$  is written for the composition map  $(\cup th(V)) \circ p^*$ .*

*Proof.* See [PS1, Defn. 3.32.(4)]. □

Analogous to [V1, p. 422] one obtains for vector bundles  $V \rightarrow X$  and  $W \rightarrow Y$  in  $\mathcal{S}m/S$  a canonical map of pointed motivic spaces  $\text{Th}(V) \wedge \text{Th}(W) \rightarrow \text{Th}(V \times_S W)$  which is a motivic weak equivalence as defined

in [PPR1, Defn. 3.1.6]. In fact, the canonical map becomes an isomorphism after Nisnevich (even Zariski) sheafification. Taking  $Y = S$  and  $W = \mathbf{1}$  the trivial line bundle yields a motivic weak equivalence  $\mathrm{Th}(V) \wedge T \rightarrow \mathrm{Th}(V \oplus \mathbf{1})$ . The canonical covering of  $\mathbf{P}^1$  defines motivic weak equivalences

$$T = \mathbf{A}^1/\mathbf{A}^1 \setminus \{0\} \xrightarrow{\sim} \mathbf{P}^1/\mathbf{A}^1 \xleftarrow{\sim} \mathbf{P}^1$$

and the arrow  $T = \mathbf{A}^1/\mathbf{A}^1 \setminus \{0\} \rightarrow \mathbf{P}^1/\mathbf{P}^1 \setminus \{0\}$  is an isomorphism. Hence one may switch between  $T$  and  $\mathbf{P}^1$  as desired.

**Corollary 2.0.5.** *For  $W = V \oplus \mathbf{1}$  consider the composite motivic weak equivalence  $\epsilon: \mathrm{Th}(V) \wedge \mathbf{P}^1 \rightarrow \mathrm{Th}(V) \wedge \mathbf{P}^1/\mathbf{A}^1 \leftarrow \mathrm{Th}(V) \wedge T \rightarrow \mathrm{Th}(W)$  in  $\mathbf{H}_\bullet(S)$ . Then the diagram*

$$\begin{array}{ccc} E^{*+2r,*+r}(\mathrm{Th}(V)) & \xrightarrow{\Sigma_{\mathbf{P}^1}} & E^{*+2r+2,*+r+1}(\mathrm{Th}(V) \wedge \mathbf{P}^1) \\ \mathrm{id} \uparrow & & \epsilon^* \uparrow \\ E^{*+2r,*+r}(\mathrm{Th}(V)) & \xrightarrow{\Sigma_T} & E^{*+2r+2,*+r+1}(\mathrm{Th}(W)) \\ \cup \mathrm{th}(V) \uparrow & & \cup \mathrm{th}(W) \uparrow \\ E^{*,*}(X) & \xrightarrow{\mathrm{id}} & E^{*,*}(X). \end{array}$$

*commutes.*

**Theorem 2.0.6.** *Let  $c_i = c_i(\mathcal{J}(n)) \in E^{2i,i}(\mathrm{Gr}(n))$  be the  $i$ -th Chern class of the tautological bundle  $\mathcal{J}(n)$ . Then*

$$E^{*,*}(\mathrm{Gr}(n)) = E^{*,*}(k)[[c_1, c_2, \dots, c_n]]$$

*is the formal power series on the  $c_i$ 's. The inclusion  $i: \mathrm{Gr}(n) \hookrightarrow \mathrm{Gr}(n+1)$  satisfies  $i^*(c_m) = c_m$  for  $m < n+1$  and  $i^*(c_{n+1}) = 0$ .*

## 2.1 A general result

The main result of this Section is Theorem 2.1.4. The complex cobordism spectrum, equipped with its natural orientation, is a universal oriented ring cohomology theory by Quillen's universality theorem [Qu1]. A motivic version of this universality theorem is proved in [PPR2] (see [Ve] for the original statement). We consider MGL with the commutative monoid structure described in [PPR2, Defn 2.1.1] and with the orientation  $\mathrm{th}^{\mathrm{MGL}}$  described in 1.1.3.

By a cofibration we mean below in the text a cofibration with respect to the closed model structure on the category  $\mathbf{M}(S)$  (see [PPR1, Appendix]).

Recall that for a  $\mathbf{P}^1$ -spectrum  $E$  and a cofibration  $Y \rightarrow X$  the group  $E^{p,q}(X, Y)$  is defined as the cohomology  $E^{p,q}(X/Y, Y/Y)$  of the pointed space  $(X/Y, +)$  (if  $Y$  is the empty set, then one should take the group  $E^{p,q}(X_+, +)$  for  $E^{p,q}(X, Y)$ ).

**Definition 2.1.1** (Universality Property). *Let  $(U, u)$  be an oriented commutative ring  $\mathbf{P}^1$ -spectrum over a field  $k$ . We say that  $(U, u)$  satisfies Quillen universality property, if for each commutative ring  $\mathbf{P}^1$ -spectrum  $E$  over  $k$  the assignment  $\varphi \mapsto \varphi(u) \in U^{2,1}(\mathrm{Th}(\mathcal{T}(1)))$  identifies the set of monoid morphisms*

$$\varphi: U \rightarrow E \quad (7)$$

in the motivic stable homotopy category  $\mathrm{SH}^{\mathrm{cm}}(S)$  with the set of orientations of  $E$ .

Let  $(U, u)$  be an oriented commutative ring  $\mathbf{P}^1$ -spectrum over  $k$ . Let  $(E, \mathrm{th})$  oriented commutative ring  $\mathbf{P}^1$ -spectrum over  $k$ . Let

$$\varphi: U \rightarrow E \quad (8)$$

be a monoid morphism in  $\mathrm{SH}^{\mathrm{cm}}(k)$  such that  $\varphi(u) = \mathrm{th}$ . For every space  $X$  over  $k$  and a cofibration  $Y \rightarrow X$  and a unique morphism  $f: X/Y \rightarrow \mathrm{Spec}(k)$  one has a commutative diagram of  $U^0(k)$ -module homomorphisms.

$$\begin{array}{ccc} U^*(X, Y) & \xrightarrow{\varphi_{X,Y}} & E^*(X, Y) \\ f^* \uparrow & & \uparrow f^* \\ U^0(k) & \xrightarrow{\varphi_S^0} & E^0(k) \end{array}$$

It is known that for each oriented commutative ring  $\mathbf{P}^1$ -spectrum  $(F, v)$  and each space  $A$  the ring  $F^0(A)$  is contained in the center of  $F^*(A)$ . The last commutative diagram induces two homomorphisms

$$\bar{\varphi}_{X,Y}: U^*(X, Y) \otimes_{U^0(k)} E^0(k) \rightarrow E^*(X, Y) \quad (9)$$

$$\bar{\varphi}_{X,Y}^0: U^0(X, Y) \otimes_{U^0(k)} E^0(k) \rightarrow E^0(X, Y) \quad (10)$$

which are natural in a cofibration  $Y \rightarrow X$ .

Since this moment choose  $(\mathrm{BGL}, \mathrm{th}^K)$  for  $(E, \mathrm{th})$  (see Example 1.1.3). Set  $\bar{U}^*(X, Y) = U^*(X, Y) \otimes_{U^0(k)} \mathrm{BGL}^0(k)$ ,  $\bar{U}^0(X, Y) = U^0(X, Y) \otimes_{U^0(k)} \mathrm{BGL}^0(k)$ .

**Definition 2.1.2** (Weakly MGL-Cellular). *A Quillen universal oriented commutative ring  $\mathbf{P}^1$ -spectrum  $(U, u)$  is called weakly MGL-cellular if there exists an integer  $N$  such that the map  $\bar{\varphi}_{U_n, *}$  is an isomorphism for  $n \geq N$ .*

**Remark 2.1.3.** By the Universality Theorem [Ve] or [PPR2] the  $\mathbf{P}^1$ -spectrum MGL is Quillen universal. That is why we choose to write MGL-cellular in the definition above. The following theorem motivates two last Definitions.

**Theorem 2.1.4.** *Let  $(U, u)$  be an oriented commutative ring  $\mathbf{P}^1$ -spectrum over a field  $k$  satisfying the Quillen universality property. Suppose  $(U, u)$  is weakly MGL-cellular. Then for each cofibration  $Y \rightarrow X$  of small spaces over the field  $k$  the homomorphism  $\bar{\varphi}_{X, Y}$  is an isomorphism.*

*Proof.* The proof consists of several steps. Our first aim is to prove that homomorphisms  $\bar{\varphi}_{X, Y}^0$  are isomorphisms. We begin with constructing a section of the natural transformation

$$\varphi^{0,0}: U^{0,0} \rightarrow \mathrm{BGL}^{0,0}$$

of functors on the category of cofibrations of small spaces. To do this we begin with recalling that for every oriented commutative  $\mathbf{P}^1$ -ring spectrum  $(E, th)$  the ring cohomology theory  $E^{*,*}|_{\mathcal{S}m\mathcal{O}p}$  is an oriented cohomology theory on the category  $\mathcal{S}m\mathcal{O}p$  (see Section 2). Let  $\mathbb{F}_{E, th}$  be the induced commutative formal group law over the ring  $E^0(k)$ . Let  $\Omega$  be the complex cobordism ring and let  $l_{E, th}: \Omega \rightarrow E^0(k)$  be the unique ring homomorphism, which takes the universal formal group  $\mathbb{F}_\Omega$  to  $\mathbb{F}_{E, th}$ . Set

$$[\mathbf{P}^n]_E = l_{E, th}([\mathbb{C}\mathbb{P}^n]), \quad (11)$$

where  $[\mathbb{C}\mathbb{P}^n]$  is the class of the complex projective space  $\mathbb{C}\mathbb{P}^n$  in  $\Omega$ . Although the class  $[\mathbf{P}^n]_E$  depends on the orientation class  $th$ , we use the notation  $[\mathbf{P}^n]_E$  instead. If  $(E', th')$  is another oriented commutative  $\mathbf{P}^1$ -ring spectrum and  $\psi: E \rightarrow E'$  is a monoid homomorphism in the category  $\mathrm{SH}^{\mathrm{cm}}(S)$  which preserves orientation classes, then it sends the formal group law  $\mathbb{F}_{E, th}$  to  $\mathbb{F}_{E', th'}$ . In particular  $\psi([\mathbf{P}^n]_E) = [\mathbf{P}^n]_{E'}$ . Applying this observation to the monoid homomorphism  $\varphi$  one obtains

$$\varphi([\mathbf{P}^1]_U) = [\mathbf{P}^1]_{\mathrm{BGL}}.$$

To compute  $[\mathbf{P}^1]_{\mathrm{BGL}}$  recall that the coefficient at  $XY$  in the formal group law  $\mathbb{F}_\Omega$  coincides with the class  $-\mathbb{C}\mathbb{P}^1$  in  $\Omega$ . The formal group law  $\mathbb{F}_{\mathrm{BGL}}$  coincides with  $X + Y + \beta^{-1}XY$ , since  $c^{\mathrm{BGL}}(L) = ([\mathbf{1}] - [\mathbf{L}^\vee])(-\beta)$ . Thus one gets

$$[\mathbf{P}^1]_{\mathrm{BGL}} = -\beta^{-1}$$

We are ready to construct a section. Consider the map

$$s: \Sigma_{\mathbf{P}^1}^\infty(\mathbb{Z} \times \text{Gr}) \rightarrow \mathbb{U} \quad (12)$$

in the stable homotopy category  $\text{SH}^{\text{cm}}(S)$  given by the element

$$c_1^{\mathbb{U}}(\infty - \tau_\infty^\vee) \cup [\mathbf{P}^1]_{\mathbb{U}} \in \mathbb{U}^{0,0}(\mathbb{Z} \times \text{Gr}).$$

**Claim 2.1.5.** One has  $\varphi(c_1^{\mathbb{U}}(\infty - \tau_\infty^\vee) \cup [\mathbf{P}^1]_{\mathbb{U}}) = \tau_\infty - \infty \in \text{BGL}^{0,0}(\mathbb{Z} \times \text{Gr})$ .

In fact,

$$\begin{aligned} \varphi(c_1^{\mathbb{U}}(\infty - \tau_\infty^\vee) \cup [\mathbf{P}^1]_{\mathbb{U}}) &= c_1^{\text{BGL}}(\infty - \tau_\infty^\vee) \cup [\mathbf{P}^1]_{\text{BGL}} = (\infty - \tau_\infty) \cup \beta \cup (-\beta^{-1}) \\ &= \tau_\infty - \infty. \end{aligned}$$

Claim 2.1.5 shows that the composite map

$$\varphi \circ s: \Sigma_{\mathbf{P}^1}^\infty(\mathbb{Z} \times \text{Gr}) \rightarrow \text{BGL}$$

coincides with the adjoint of the motivic weak equivalence  $i: \mathbb{Z} \times \text{Gr} \rightarrow \mathcal{K} = \mathcal{K}_0$  from [PPR1, Lemma 1.2.2]. Thus for every cofibration  $Y \rightarrow X$  of small motivic spaces the map

$$s_{X,Y}: \text{BGL}^{0,0}(X/Y) = [X/Y, \mathcal{K}_0] = [X/Y, \mathbb{Z} \times \text{Gr}] \rightarrow [\Sigma_{\mathbf{P}^1}^\infty(X/Y), \mathbb{U}] = \mathbb{U}^{0,0}(X/Y)$$

is a *section* of the map  $\varphi_{X,Y}^{0,0}: \mathbb{U}^{0,0}(X, Y) \rightarrow \text{BGL}^{0,0}(X, Y)$ . Moreover, the section  $s_{X,Y}$  is natural in the cofibration  $Y \rightarrow X$ .

Next we extend the section  $s$  to a section  $\bar{s}^0: \text{BGL}^0 \rightarrow \bar{\mathbb{U}}^0$  of the natural transformation  $\bar{\varphi}^0: \bar{\mathbb{U}}^0 \rightarrow \text{BGL}^0$  of functors on the category of cofibrations. To achieve this, recall that

$$\text{BGL}^0 = \text{BGL}^{0,0}[\beta, \beta^{-1}]$$

for the Bott element  $\beta \in \text{BGL}^{2,1}(k)$  (see (2)). Thus for every cofibration  $Y \rightarrow X$  every element  $\alpha \in \text{BGL}^0(X, Y)$  can be presented in a unique way in the form  $a \cup \beta^i$  with  $a \in \text{BGL}^{0,0}(X, Y)$ . Define

$$\bar{s}_{X,Y}^0: \text{BGL}^0 \rightarrow \bar{\mathbb{U}}^0 \quad (13)$$

by  $\bar{s}_{X,Y}^0(a \cup \beta^i) = s_{X,Y}(a) \otimes \beta^i \in \bar{\mathbb{U}}^0(A)$ , where  $a \in \text{BGL}^{0,0}(X, Y)$ . It is immediate that  $\bar{s}_A^0$  is natural in cofibration  $Y \rightarrow X$ . The following computation proves the claim which is right below the row of computation

$$\bar{\varphi}_A^0(\bar{s}^0(a \cup \beta^i)) = \bar{\varphi}_A^0(s(a) \otimes \beta^i) = \varphi(s(a)) \cup \beta^i = a \cup \beta^i.$$

**Claim 2.1.6.** The map  $\bar{s}_{X,Y}^0$  is a section of  $\bar{\varphi}_{X,Y}^0$ .

Now observe the following. If for a cofibration  $Y \rightarrow X$  the map  $\bar{\varphi}_{X,Y}^0$  is an isomorphism, then  $\bar{s}_{X,Y}^0$  is an isomorphism inverse to  $\bar{\varphi}_{X,Y}^0$ . In particular, one has  $\bar{s}_{X,Y}^0 \circ \bar{\varphi}_{X,Y}^0 = \text{id}$ .

The homomorphism  $\bar{\varphi}_{X,Y}^0$  is an isomorphism for cofibrations of the form  $* \rightarrow U_n$  with  $n \geq N$ , since  $U$  is weakly MGL-cellular. Taking  $* \rightarrow U_n$  as a cofibration  $Y \rightarrow X$  and the class  $[u_n] \in U^{2n,n}(U_n, *)$  of the canonical morphism  $u_n: \Sigma_{\mathbf{P}^1}^\infty U_n(-n) \rightarrow U$  we get the following relation:

$$(\bar{s}_{U_n,*}^0 \circ \varphi_{U_n,*}^0)([u_n]) = [u_n] \otimes 1 \in \bar{U}^0(U_n, *). \quad (14)$$

Now we are ready to check that  $\bar{\varphi}_A^0$  is an isomorphism for all cofibrations  $Y \rightarrow X$  of small motivic spaces. Recall that for a cofibrations  $Y \rightarrow X$  of small motivic spaces there is a canonical isomorphism of the form

$$U^{2i,i}(X, Y) = \text{colim}_n [\Sigma^{2n,n}(X/Y, Y/Y), U_{i+n}]_{\mathbf{H}_\bullet(S)} \quad (15)$$

where  $\Sigma^{2n,n} = \Sigma_{\mathbf{P}^1}^n$  (if  $Y$  is empty then one should replace the pair  $(X/Y, Y/Y)$  by the one  $(X_+, +)$ ). This isomorphism implies that for every element  $a \in U^{2i,i}(X, Y)$  there exists an integer  $n \geq 0$  such that  $\Sigma^{2n,n}(a) = f^*([u_n])$  for an appropriate map  $f: \Sigma^{2n,n}(X/Y) \rightarrow U_{i+n}$  in the homotopy category  $\mathbf{H}_\bullet^m(S)$ . Here  $\Sigma^{2n,n}(a)$  is the  $n$ -fold  $\Sigma_{\mathbf{P}^1}$ -suspension of  $a$ .

The surjectivity of  $\bar{\varphi}_{X,Y}^0$  is clear, since  $\bar{s}_{X,Y}^0$  is its section. It remains to check the injectivity of  $\bar{\varphi}_{X,Y}^0$ . Take a homogeneous element  $\alpha \in \bar{U}^{2i,i}(X, Y) \subseteq \bar{U}^0(X, Y)$  such that  $\bar{\varphi}_{X,Y}^0(\alpha) = 0$ . It has the form  $\alpha = a \otimes \beta^m$  for a homogeneous element  $a \in U^{0,0}(X, Y)$ . Since the element  $\beta$  is invertible in  $\text{BGL}^{*,*}(k)$ , one concludes  $\varphi_{X,Y}^0(a) = 0$ .

Choose an integer  $n \geq 0$  such that  $\Sigma^{2n,n}(a) = f^*([u_n])$  and write  $A$  for  $X/Y$  to short the notation. The map  $\varphi$  of  $\mathbf{P}^1$ -spectra respects the suspension isomorphisms. Thus  $\varphi_{\Sigma^{2n,n}A}(\Sigma^{2n,n}(a)) = \Sigma^{2n,n}(\varphi_A(a)) = 0$  and  $(\bar{s}_{\Sigma^{2n,n}A}^0 \circ \varphi_{\Sigma^{2n,n}A})(\Sigma^{2n,n}(a)) = 0$  too. The chain of relations in  $\bar{U}^0(\Sigma^{2n,n}A)$  given by

$$\begin{aligned} 0 &= (\bar{s}_{\Sigma^{2n,n}A}^0 \circ \varphi_{\Sigma^{2n,n}A})(\Sigma^{2n,n}(a)) = (\bar{s}_{\Sigma^{2n,n}A}^0 \circ \varphi_{\Sigma^{2n,n}A})(f^*([u_n])) \\ &= f^*((\bar{s}_{U_{n+i}}^0 \circ \varphi_{U_{n+i}})([u_n])) = f^*([u_n] \otimes 1) = f^*([u_n]) \otimes 1 \\ &= \Sigma^{2n,n}(a) \otimes 1 \end{aligned}$$

implies that  $\Sigma^{2n,n}(a \otimes 1) = \Sigma^{2n,n}(a) \otimes 1 = 0$ . Because the  $n$ -fold suspension map

$$\Sigma^{2n,n}: \bar{U}^0(X/Y, Y/Y) \rightarrow \bar{U}^0(\Sigma^{2n,n}(X/Y, Y/Y))$$

is an isomorphism,  $a \otimes 1 = 0$  in  $\overline{U}^0(X/Y) = \overline{U}^0(X, Y)$ . This proves the injectivity and hence the bijectivity of  $\overline{\varphi}_{X,Y}^0$  for cofibrations of all small motivic spaces.

To prove that  $\overline{\varphi}_{X,Y}$  is an isomorphism for cofibrations of all small motivic spaces we will use the fact that  $\overline{\varphi}_{X,Y}$  respects the  $\mathbf{P}^1$ -suspension isomorphisms. Set  $A = X/Y$ .

For every integer  $i \in \mathbb{Z}$  choose an integer  $n \geq 0$  with  $n \geq i$ . Then for a pointed motivic space  $A$  one may form the suspension  $\mathbb{G}_m^{\wedge n} \wedge S_s^{n-i} \wedge A = S^{n,n} \wedge S^{n-i,0} \wedge A$  in the category of pointed motivic spaces, which supplies the commutative diagram

$$\begin{array}{ccccc} \mathrm{BGL}^i(A) & \xrightarrow[\cong]{\Sigma^{2n,n}} & \mathrm{BGL}^i(S^{2n,n} \wedge A) & \xleftarrow[\cong]{\Sigma^{i,0}} & \mathrm{BGL}^0(S^{n,n} \wedge S^{n-i,0} \wedge A) \\ \overline{\varphi}_A^i \uparrow & & \overline{\varphi}_{S^{2n,n} \wedge A}^i \uparrow & & \cong \uparrow \overline{\varphi}_{S^{n,n} \wedge S^{n-i,0} \wedge A}^0 \\ \mathrm{U}^i(A) & \xrightarrow[\cong]{\Sigma^{2n,n}} & \mathrm{U}^i(S^{2n,n} \wedge A) & \xleftarrow[\cong]{\Sigma^{i,0}} & \mathrm{U}^0(S^{n,n} \wedge S^{n-i,0} \wedge A) \end{array}$$

with the suspension isomorphisms  $\Sigma^{2n,n} = \Sigma_{\mathbf{P}^1}^n$  and  $\Sigma^{i,0}$ . The map  $\overline{\varphi}_B^0$  is an isomorphism for  $B$  a small pointed motivic space, hence so is  $\overline{\varphi}_A^i$ . We proved that the map  $\overline{\varphi}_{X,Y}$  is an isomorphism. Theorem 2.1.4 is proven.  $\square$

## 2.2 The MGL-cellularity of the MGL

**Theorem 2.2.1.** *The oriented commutative ring  $\mathbf{P}^1$ -spectrum  $(\mathrm{MGL}, th^{\mathrm{MGL}})$  from Example 1.1.3 is weakly MGL-cellular.*

*Proof.* We must check that the homomorphism  $\overline{\varphi}_{X,Y}^0$  is an isomorphism for  $(X, Y)$  being  $(Th(\mathcal{T}_n), *) = (\mathrm{MGL}_n, *)$ . We check that inspecting step by step motivic spaces  $\mathrm{Spec}(k)$ ,  $\mathbf{P}^\infty$ ,  $\mathrm{Gr}(n)$  and the pair  $(Th(\mathcal{T}_n), *) = (\mathrm{MGL}_n, *)$ .

The map  $\overline{\varphi}_k^0$  is an isomorphism, since it is the identity map. By the case  $n = 1$  of Theorem 2.0.6 one has  $\overline{\mathrm{MGL}}^*(\mathbf{P}^\infty) = \overline{\mathrm{MGL}}^*(k)[[c^{\mathrm{MGL}}]]$ , whence

$$\overline{\mathrm{MGL}}^0(\mathbf{P}^\infty) = \overline{\mathrm{MGL}}^0(k)[[c^{\mathrm{MGL}}]]$$

(the formal power series on the first Chern class  $c^{\mathrm{MGL}}$  of the tautological line bundle  $\mathcal{O}(-1)$ ). The same holds for BGL. Namely

$$\mathrm{BGL}^0(\mathbf{P}^\infty) = \mathrm{BGL}^0(k)[[c^{\mathrm{BGL}}]].$$

By its definition the morphism  $\varphi$  takes the orientation class  $th^{\mathrm{MGL}}$  to the orientation class  $th^K$  and so it preserves the first Chern class. Whence the map

$\bar{\varphi}_{\mathbf{P}^\infty}^0$  coincides with a map of formal power series induced by the isomorphism  $\bar{\varphi}_k^0$  of the coefficients rings. Hence  $\bar{\varphi}_{\mathbf{P}^\infty}^0$  is an isomorphism as well.

Consider now  $X = \text{Gr}(n)$ . By Theorem 2.0.6 its MGL-cohomology ring is the ring of formal power series on the Chern classes of the tautological bundle  $\mathcal{T}_n$  over the coefficient ring  $\text{MGL}^{*,*}(k)$ . The same holds for the BGL-cohomology ring. As observed above, the map  $\varphi$  preserves the first Chern class, thus it takes Chern classes to the Chern classes. Whence  $\bar{\varphi}_{\text{Gr}(n)}^0$  is an isomorphism as well.

Now consider  $(X, Y) = (\text{Th}(\mathcal{T}_n), *)$ . The morphism  $\varphi$  respects Thom classes (see (5) and (6)). The vertical arrows in the commutative diagram

$$\begin{array}{ccc} \overline{\text{MGL}}^0((\text{Th}(\mathcal{T}_n), *)) & \xrightarrow{\bar{\varphi}_{\text{Th}(\mathcal{T}_n), *}^0} & \text{BGL}^0(\text{Th}(\mathcal{T}_n)) \\ \text{thom}^{\text{MGL}} \uparrow & & \uparrow \text{thom}^{\text{BGL}} \\ \overline{\text{MGL}}^0(\text{Gr}(n)) & \xrightarrow{\bar{\varphi}_{\text{Gr}(n)}^0} & \text{BGL}^0(G(n)) \end{array}$$

are isomorphisms induced by the the Thom isomorphism 2.0.4. The map  $\bar{\varphi}_{\text{Gr}(n)}^0$  is an isomorphism by the preceding case, whence  $\bar{\varphi}_{\text{Th}(\mathcal{T}_n), *}^0$  is an isomorphism too. □

## 2.3 Main Result

Let  $k$  be a field and  $S = \text{Spec}(k)$ . By Theorem [PPR2, Theorem 2.2.1] and Example 1.1.3 there exists a unique monoid morphism

$$\varphi: \text{MGL} \rightarrow \text{BGL} \tag{16}$$

in  $\text{SH}^{\text{cm}}(S)$  such that  $\varphi(th^{\text{MGL}}) = th^K$ . For every cofibration  $Y \rightarrow X$  of motivic spaces over  $k$  a unique morphism  $f: X/Y \rightarrow S$  induces the homomorphism

$$\bar{\varphi}_{X,Y}: \overline{\text{MGL}}^*(X, Y) := \text{MGL}^*(X, Y) \otimes_{\text{MGL}^0(k)} \text{BGL}^0(k) \rightarrow \text{BGL}^*(X, Y) \tag{17}$$

which is natural in cofibration  $Y \rightarrow X$ . Recall that a space  $A$  is called small if the covariant functor  $\Sigma_{\mathbf{P}^1}^\infty A$  represents on  $\text{SH}^{\text{cm}}(S)$  commutes with arbitrary coproducts.

**Theorem 2.3.1.** *The homomorphism  $\bar{\varphi}_{X,Y}$  is an isomorphism for all cofibrations  $Y \rightarrow X$  of small motivic spaces.*

In fact, the  $(\mathrm{MGL}, th^{\mathrm{MGL}})$  is Quillen universal by [Ve] or by Theorem 2.2.1 from [PPR2] and weakly MGL-cellular by Theorem 2.2.1 above. Theorem 2.1.4 completes the proof.

**Remark 2.3.2.** There is an unpublished result due to Morel and Hopkins, which states that there is a canonical isomorphism of the form

$$\mathrm{MGL}^{*,*}(X) \otimes_{\mathbb{L}} \mathbb{Z}[\beta, \beta^{-1}] \rightarrow \mathrm{BGL}^{*,*}(X)$$

where  $\mathbb{L}$  denotes the Lazard ring carrying the universal formal group law. If the canonical homomorphism  $\mathbb{L} \rightarrow \mathrm{MGL}^0(k)$  is an isomorphism, Theorem 2.3.1 implies their result.

Let  $X$  be a smooth  $k$ -scheme and  $Z \subseteq X$  a closed subset, with open complement  $U \subseteq X$ . Consider the motivic space  $X/U$  and take the quotients of both sides of the isomorphism (17) modulo the principal ideal generated by the element  $1 \otimes (\beta + 1)$ . Corollary 1.0.1 then implies the following isomorphism

$$\bar{\varphi}_{X/U}: \overline{\mathrm{MGL}}^*(X, Y) = \mathrm{MGL}^*(X/U) \otimes_{\mathrm{MGL}^0(k)} \mathbb{Z} \rightarrow K_{-*,Z}^{TT}(X) \quad (18)$$

where  $K_{*,Z}^{TT}(X)$  are the Thomason-Trobaugh  $K$ -groups with supports. This family of isomorphisms shows that the functor

$$(X, X \setminus Z) \mapsto \mathrm{MGL}^*(X/(X \setminus Z)) \otimes_{\mathrm{MGL}^0(k)} \mathbb{Z} =: \overline{\mathrm{MGL}}^*(X/(X \setminus Z))$$

is a ring cohomology theory in the sense of [PS1]. This implies the first part of our main result.

**Theorem 2.3.3** (Main Theorem). *Let  $X \in \mathcal{S}m_k$  and  $Z \subseteq X$  be a closed subset.*

- *The family of isomorphisms*

$$\bar{\varphi}_{X/(X-Z)}: \overline{\mathrm{MGL}}^*(X/(X \setminus Z)) \rightarrow K_{-*,Z}^{TT}(X) \quad (19)$$

*form an isomorphism  $\bar{\varphi}$  of ring cohomology theories on  $\mathcal{S}m\mathrm{Op}/k$ .*

- *The  $\bar{\varphi}$  respects orientations provided that  $\mathrm{MGL}^*$  and  $K_{-*,Z}^{TT}$  are considered as oriented cohomology theories in the sense of [PS1] with orientations given by the Thom class  $th^{\mathrm{MGL}} \otimes 1$  from 1.1.3 and the Chern structure  $L/X \mapsto [\mathcal{O}] - [L^{-1}]$ . In particular, the composition*

$$\mathrm{MGL}^0(k) \longrightarrow \mathrm{MGL}^0(k) \otimes \mathbb{Z} \longrightarrow \mathbb{Z}$$

$$a \longmapsto a \otimes 1 \quad b \otimes c \longmapsto \varphi(b) \cdot c$$

sends the class  $[X] \in \mathrm{MGL}^0(X)$  of a smooth projective  $k$ -variety  $X$  to the Euler characteristic  $\chi(X, \mathcal{O}_X)$  of the structure sheaf  $\mathcal{O}_X$ .

*Proof.* The first part is already proven. To prove the second one consider the orientations  $th^{\mathrm{MGL}}$  and  $th^K$  from 1.1.3. Note that by the very definition of  $\varphi$  it sends  $th^{\mathrm{MGL}}$  to  $th^K$ . Thus it respects the Chern structures on  $\mathrm{MGL}^*$  and  $\mathrm{BGL}^*$  described in Section 2.

The quotient map  $\mathrm{BGL}^* \rightarrow K_{-*}^{TT}$  takes the Bott element  $\beta$  to  $(-1)$ . Thus it takes the Chern structure on  $\mathrm{BGL}^*$  to the Chern structure on  $K_{-*}^{TT}$  given by  $L/X \mapsto [\mathcal{O}] - [L^{-1}] \in K_0(X)$ . This shows that  $\bar{\varphi}: \overline{\mathrm{MGL}}^* \rightarrow K_{-*}^{TT}$  respects the orientations described in the Theorem 2.3.3.

Let  $f \mapsto f_{\mathrm{MGL}}$  resp.  $f \mapsto f_K$  be the integrations on  $\mathrm{MGL}^*$  resp.  $K_{-*}^{TT}$  given by these Chern structures via Theorem [PS3, Thm. 4.1.4]. By Theorem [PS2, Thm. 1.1.10] the composition  $\mathrm{MGL}^* \rightarrow \mathrm{BGL}^* \rightarrow K_{-*}^{TT}$  respects the integrations on  $\mathrm{MGL}^*$  and  $K_{-*}^{TT}$  since it preserves the Chern structures. In particular, given a smooth projective  $S$ -scheme  $f: X \rightarrow \mathrm{Spec}(k)$ , the diagram

$$\begin{array}{ccc} \overline{\mathrm{MGL}}^0(X) & \xrightarrow{\bar{\varphi}} & K_0^{TT}(X) \\ f_{\mathrm{MGL}} \downarrow & & \downarrow f_K \\ \overline{\mathrm{MGL}}^0(k) & \xrightarrow{\bar{\varphi}} & K_0^{TT}(k) \end{array}$$

commutes where  $f_{\mathrm{MGL}}$  and  $f_K$  are the push-forward maps for  $\mathrm{MGL}^*$  and  $K_{-*}^{TT}$  respectively. The integration  $f \mapsto f_K$  on  $K_{-*}^{TT}$  respecting the Chern structure  $L \mapsto [\mathcal{O}] - [L^{-1}]$  coincides with the one given by the higher direct images by Theorem [PS2, Thm. 1.1.11]. The last one sends the class  $[V] \in K_0(X)$  of a vector bundle  $V$  over a smooth projective variety  $X$  to the Euler characteristic  $\chi(X, \mathcal{V})$  of the sheaf  $\mathcal{V}$  of sections of  $V$ .

Recall that for an oriented cohomology theory  $A$  with a Chern structure  $L \mapsto c(L)$  and for a smooth projective variety  $f: X \rightarrow \mathrm{Spec}(k)$  its class  $[X]_A \in A^{\mathrm{even}}(\mathrm{Spec}(k))$  is defined as  $f_A(1)$ , where  $f_A: A(X) \rightarrow A(\mathrm{Spec}(k))$  is the push-forward respecting the Chern structure (see [PS3, Thm. 4.1.4]). The  $f_A$  depends on the Chern structure. However we write just  $f_A$  for the push-forward operator. Taking the element  $1 \in \mathrm{MGL}^{0,0}(X)$  and using the commutativity of the very last diagram we see that

$$\bar{\varphi}([X]_{\mathrm{MGL}} \otimes 1) = \chi(X, \mathcal{O}_X).$$

Whence the Theorem. □
