Summer term 2007

Assignment sheet 6

(21) Prove that

$$F(a, x) = ax(1 - x)$$

has a period doubling bifurcation at $a = 3$.

(22) Consider the logistic map

$$F(a, x) = ax(1 - x)$$

again.

- (a) What happens at $a = 0$? How many fixed points are there? What is their stability, are they attracting or repelling? Are there any eventually fixed or periodic points?
- (b) Find a bifurcation for $a < 0$. What kind of bifurcation is it?
- (c) Do you expect further bifurcations? What do you guess? How could the bifurcation diagram look like?

(23) Consider the family of maps

$$f_a(x) = a + e^{-x} - 1.$$

- (a) Proof that there is exactly one fixed point for any a . *Hint: Use the intermediate value theorem. What do you know about the derivative of f_a ?*
- (b) Is there a bifurcation? If no, why not. If yes, what kind of bifurcation is it?

(24) Consider the dynamical system given by the function

$$f(x) = \begin{cases} 1 & \text{for } x = 0 \\ 2 & \text{for } x = 1 \\ 0 & \text{otherwise.} \end{cases}$$

- (a) Are there any (eventually) fixed points? Are there any (eventually) periodic orbits? If yes, what is their period?
- (b) What does this example show?

Please hand in until 18.5.2007.
