# Some groups in this direction

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

Finite dimensional tilting theory is well-known.

Let us look at the infinite dimensional tilting theory.

There are several groups in this area:

- (1) **Italy** [Angeleri-Huegel, Bazzoni, Colpi, Mantese, Pavarin, Tonolo, ...]
- (2) **Spain** [Herbera, Nicolas, Sanchez, Saorin, ...]
- (3) **Czech** [Stovicek, Trifaj, ...]
- (4) **Germany** [Koenig and his group, ...]
- (5) ...

# Main aim

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

Some developments on **infinitely** generated tilting modules in terms of derived module categories. But restrict to [3] and [4]

$A$ :	ring with 1
$A\text{-Mod}$ :	cat. of all left $R$ -modules
$\text{add}(M)$ :	summands of f. dir. sums of $M$
$\text{Add}(M)$ :	summands of dir. sums of $M$
$\mathcal{D}(A)$ :	derived cat. of $A$ (or $A\text{-Mod}$ )

# Definition of tilting modules

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

## Definition

*n*-tilting module  ${}_A T$ :

(1)  $pd_A(T) \leq n: P^\bullet \longrightarrow T \longrightarrow 0,$

(2)  $\text{Ext}_A^i(T, T^{(I)}) = 0$  for all  $i > 0$  and all set  $I,$

(3) exact seq.:  $0 \rightarrow {}_A A \rightarrow T_0 \rightarrow \cdots \rightarrow T_n \rightarrow 0, T_j \in \text{Add}(T).$

- *good* if  $T_i \in \text{add}(T).$
- *classical* if good and f.g.

Define  $B := \text{End}_A(T)$

## Theorem (Bazzoni, Bazzoni-Mantese-Tonolo)

${}_A T: n$ -tilting  $\implies \mathcal{D}(A)$ : subcategory or quotient of  $\mathcal{D}(B)$ .

In fact:  $\mathcal{D}(B)/\text{Ker}(T \otimes_B^{\mathbb{L}} -) \simeq \mathcal{D}(A)$

Note:

- New triangulated categories
- No derived invariants

## Definition

*A ring epimorphism  $\lambda : R \rightarrow S$  is called **homological** if  $\mathrm{Tor}_j^R(S, S) = 0$  for  $j > 0$ .*

Or equivalently, the restriction functor  $D(\lambda_*) : \mathcal{D}(S) \rightarrow \mathcal{D}(R)$  is fully faithful.

Counterexamples and open questions

## Theorem

$A$   $T$ : good tilt.,  $\text{proj.dim} \leq 1$ ,  $\implies \exists$  homolog. ring epi.  $B \rightarrow C$  and recollement:

$$\begin{array}{ccccc} & \curvearrowright & & \curvearrowleft & \\ \mathcal{D}(C) & \longrightarrow & \mathcal{D}(B) & \xrightarrow{j^!} & \mathcal{D}(A) \\ & \curvearrowleft & & \curvearrowright & \end{array}$$

- $T$ : classical,  $\implies C = 0$ , Happel Theorem.
- $j^! := T \otimes_B -$ ,  $\text{Ker}(j^!) \simeq \mathcal{D}(C)$ .
- $C$ : universal localization of  $B$ .

# General case

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

This is a difficult question!

It is related to questions:

(1) When is a universal localization homological?

(2) When is a full triangulated subcategory  $\mathcal{T}$  of  $\mathcal{D}(B)$  realisable as a der. module cat.?

Question (1) is a very general, old question. Question (2) may be new, but also very general. We shall consider a special case which is related to inf. g. tilting modules.

# Definition of exact pairs of ring homomorphisms

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

$\lambda : R \longrightarrow S, \mu : R \longrightarrow T$  are ring hom.s.

The pair  $(\lambda, \mu)$  is called **exact** if

$$0 \longrightarrow R \longrightarrow S \oplus T \xrightarrow{\begin{pmatrix} \lambda \otimes 1 \\ -1 \otimes \mu \end{pmatrix}} S \otimes_R T \longrightarrow 0$$

is exact as  $R$ - $R$ -bimodules.

- The coproduct  $S \sqcup_R T$ :

$$\begin{array}{ccc}
 R & \xrightarrow{\lambda} & S \\
 \mu \downarrow & & \downarrow \rho \\
 T & \xrightarrow{\varphi} & S \sqcup_R T.
 \end{array}$$

- Define a universal localization (due to Schofield):

$$\theta: B := \begin{pmatrix} S & S \otimes_R T \\ 0 & T \end{pmatrix} \longrightarrow \begin{pmatrix} S \sqcup_R T & S \sqcup_R T \\ S \sqcup_R T & S \sqcup_R T \end{pmatrix} =: C,$$

$$\begin{pmatrix} s_1 & s_2 \otimes t_2 \\ 0 & t_1 \end{pmatrix} \mapsto \begin{pmatrix} (s_1)\rho & (s_2)\rho(t_2)\varphi \\ 0 & (t_1)\varphi \end{pmatrix}$$

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

This  $\theta$  is related to inf. g. tilting modules. So our question is:

When is  $\theta$  homological?

Remark. If  $\theta$ : homolog., then  $\exists$  a recollement

$$\mathcal{D}(S \sqcup_R T) \rightleftarrows \mathcal{D}(B) \rightleftarrows \mathcal{D}(R)$$

## Corollary

*$A$ : comm.,  ${}_A T$ : good  $n$ -tilt. mod. s.t.*

*$\text{Hom}_A(T_{i+1}, T_i) = 0$  for  $1 \leq i \leq n - 1 \implies$*

*$\text{Ker}(T \otimes_B^{\mathbb{L}} -)$  is homolog. if and only if  $\text{proj.dim}({}_A T) \leq 1$ .*

# Counterexample

Main purpose of this talk

Happel-CPS-Rickard-Keller Theorem for classical tilting modules

Modern tilting theory

Exact pairs

Homological subcategories

Counterexamples and open questions

For  $n \geq 2$ , there is an  $n$ -tilting  $A$ -module  $T$  such that  $\text{Ker}(T \otimes_B^{\mathbb{L}} -)$  is not homological. Thus there is no homol. ring epi  $B \rightarrow C$  such that the following recollement exists:

$$\mathcal{D}(C) \begin{array}{c} \longleftarrow \\ \longrightarrow \\ \longleftarrow \\ \longrightarrow \end{array} \mathcal{D}(B) \begin{array}{c} \longleftarrow \\ \xrightarrow{j^!} \\ \longleftarrow \\ \longrightarrow \end{array} \mathcal{D}(A)$$

$$j^! := T \otimes_B^{\mathbb{L}} -$$

# open question
